Background

Inappropriate prescribing is a problem of major concern in older patients, given the increased risk of adverse drug events and mortality. In this context, a screening tool based on the Screening Tool for Older Person's Prescriptions (STOPP) and Screening Tool to Alert doctors to Right Treatment (START) criteria¹ was developed and applied in the geriatric unit at CHU Dinant Godinne.

The aim of this study was to assess if the implementation of this screening tool leads to a reduction of potentially inappropriate medications (PIM) and potential prescribing omission (PPO) during the hospitalization.

Figure 1: Screening tool based on the STOPP and START criteria

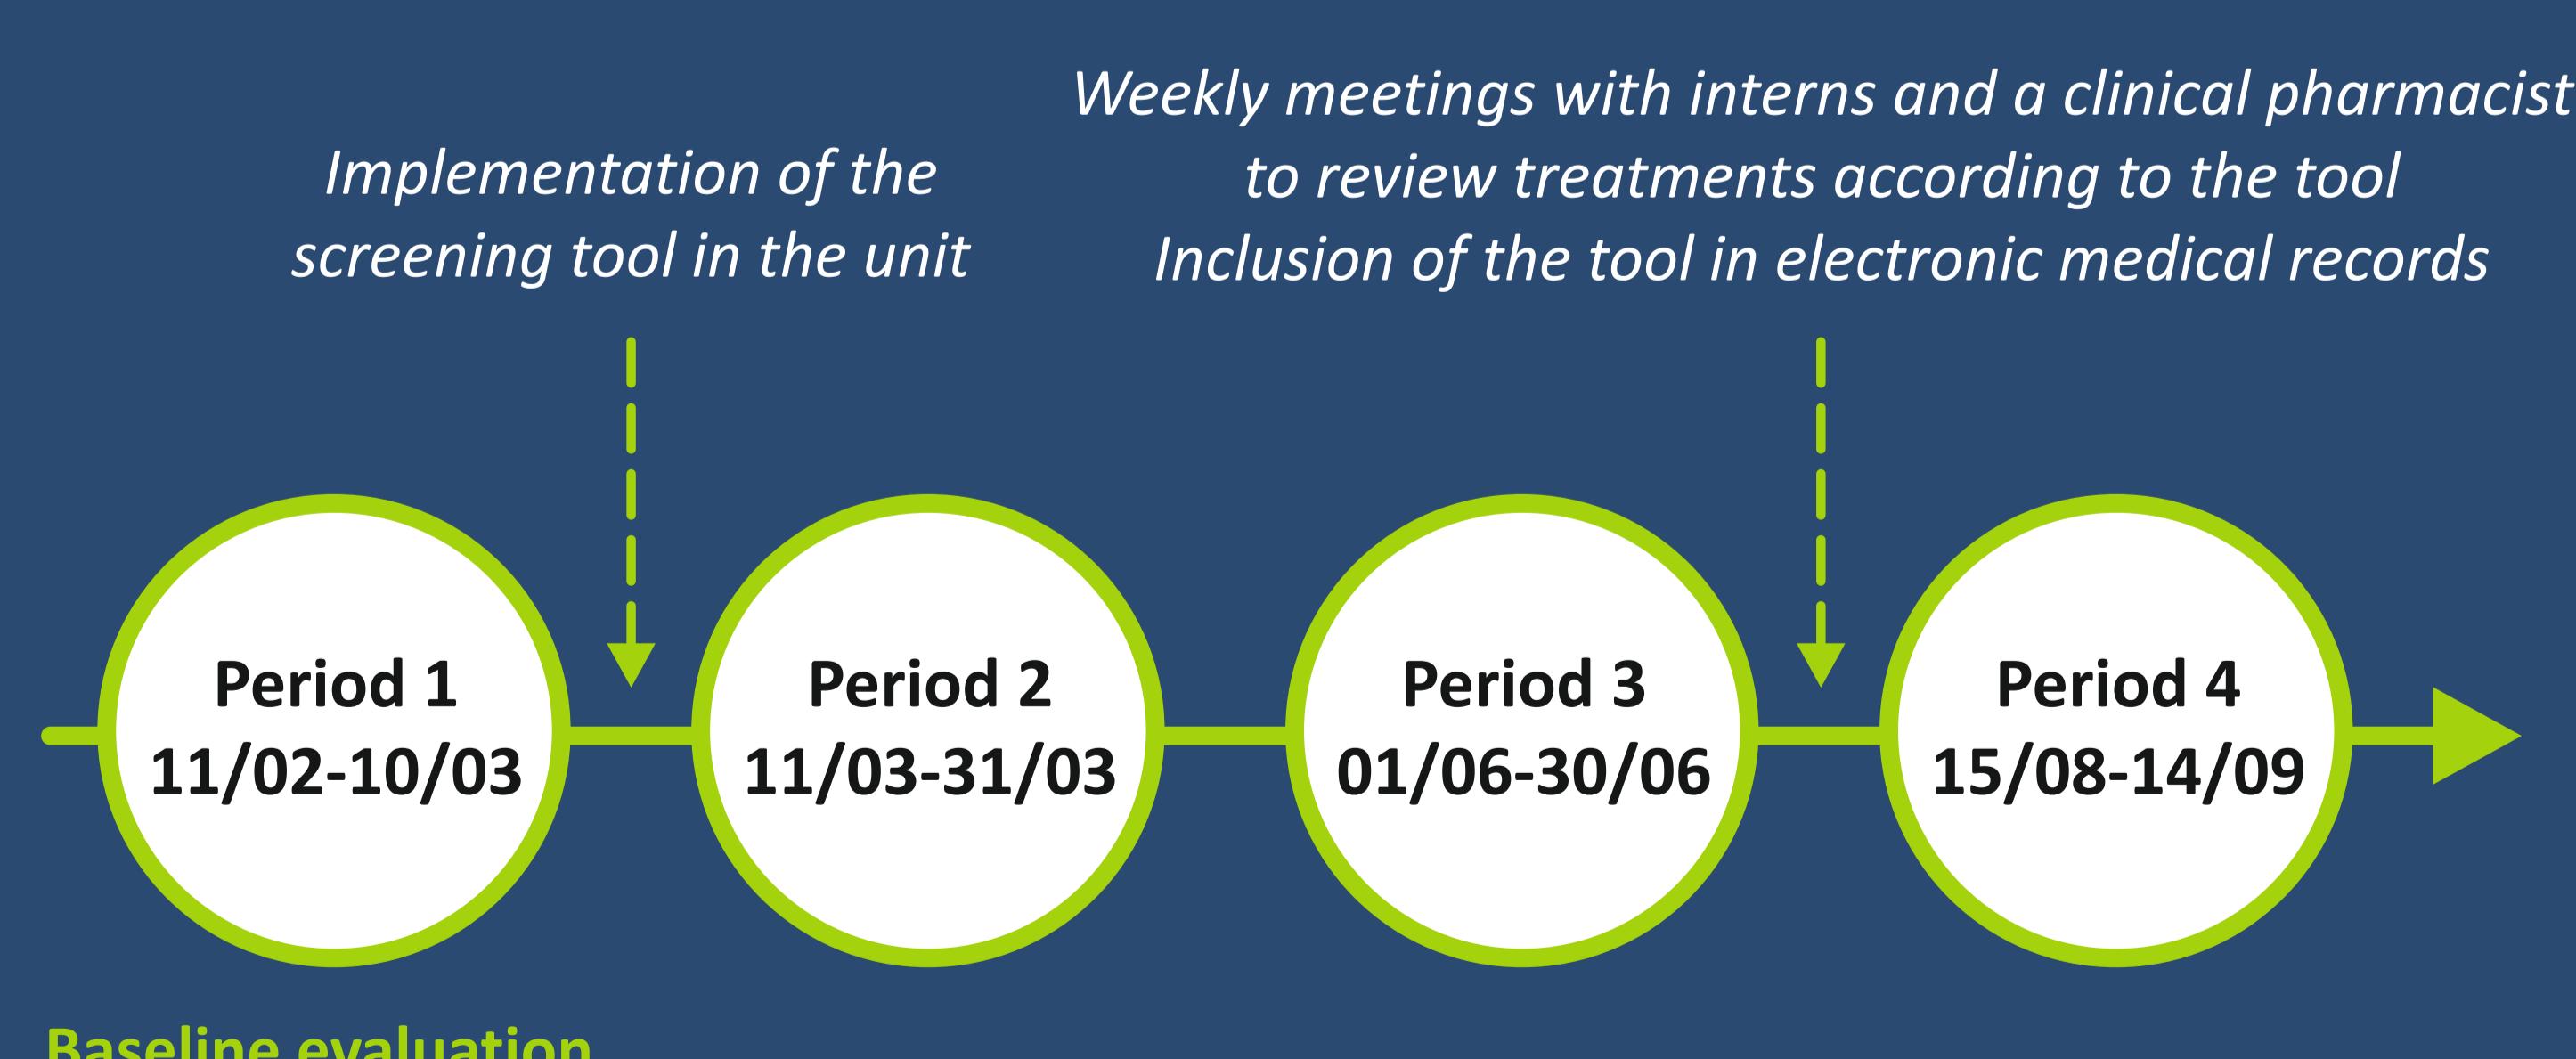

START & STOPP		Et si...		Étiquette/Badge du patient
Pour la bonne prise en charge des patients gériatriques à Mont-Godinne. Sélection des médicaments les plus souvent inappropriés.		Si...		Si...
Si...	START !	Si...	Et si...	Stopper (ou adapter)
FA et PAS de CI aux AVK (épisode hémorragique, thromboembolie, cirrhose, non-compliance. Les chutes ne sont pas une CI majeure)	Oui Non	Benzodiazépines	A longue durée d'action utilisée - 1 mois (longue durée ou métabolites actifs longue durée: Prisin, doxaz, Roaccinol, Benazepril, Transtane-diazépate, Vallum-diazépam, Asophen-diazépam, Stauridom-flurazépam, Vistar-isoflazépate, Mogadon-nitrazépam, Calmiday-nordiazépam, Lysana-prazepam, Mykofenotetrazeptam)	Oui Non (progressivement)
FA et PAS de CI aux AVK	Oui Non	Aspirine	ATCD de chute ces 3 derniers mois	Oui Non
		Aspirine	Dose > 150mg (Diminuer la dose. Pas de bénéfices supplémentaires vs EII)	Oui Non
		Diabète et ≥ 1 facteur de risque CV (HTA, cholestérol, tabac)	Prévention primaire (sans diabète) (pas d'ATCD coronaire, pas d'AVC, pas de maladie vasculaire périphérique, pas d'occlusion, pas de revascularisation)	Oui Non
		Statine	Maladie hémorragique	Oui Non
		Béta-bloquant	En combinaison au Verapamil (Risque de BAV)	Oui Non (progressivement)
			Non cardio-sélectif et BPCO (Non cardio-selectif B1: Visken+prindolol, Inderal+propranolol, Selamet+metolol, Kroton+Carvediol)	Oui Non
		Opiode	Puissant en première ligne au long cours (analgésiques puissants: fentanyl, hydromorphone, morphine, méthadone, oxycodone, piritramide)	Oui Non
			Au long cours et ATCD de chute ces 3 derniers mois	Oui Non
			> 2 semaines et constipation chronique importante	Oui Non
		AINS ou Aspirine	Au long cours chez patient dément (sf soins palliatifs/douleur chronique)	Oui Non
			ATCD d'ulcère gastrique et utilisé sans protection gastrique (IPF ou antiH2)	Oui Non
		AINS	Combination aux AVK sans protection gastrique (IPF ou antiH2)	Oui Non
			HTA-160/100 non contrôlée par la médication.	Oui Non
		IPP	Insuffisance cardiaque ou Insuffisance rénale	Oui Non
			Traitement à dose maximale depuis > 8 semaines en traitement d'une pathologie ulcéreuse. (suggéré de réduire la dose progressivement pour éviter la réécurrence des symptômes) (Pantoprazole 40mg, Nexium+ esomeprazole 40mg)	Oui Non

The tool was a short version of the STOPP and START criteria drawn from Belgian data on prevalence and clinical relevance.

Methods

We conducted a retrospective interrupted time series analysis. Four periods were selected between February and September 2013.

Figure 2: design of the study

Demographic, clinical and pharmaceutical data were collected according to the discharge letter. The screening tool was applied to each treatment, on admission and at discharge. The primary outcome was the rate of PIMs discontinued and PPOs corrected during hospitalization.

Results

120 patients (median age 85 years) were included in the study. The prevalence of PIMs and PPOs on admission was 56% (67/120) and 51% (61/120) respectively. At baseline (period 1), 20% of PIMs were discontinued during hospitalization while 22% of PPOs were corrected. The reduction in PIMs and PPOs improved when the screening tool was implemented in the unit (period 2; 26% and 38% respectively), but three months later this effect had disappeared (period 3; 15% and 19% respectively). We observed the greatest reduction in PIMs and PPOs for the last study period (period 4; 58% and 43% respectively).

Figure 3: Potentially inappropriate medications (PIMs) on admission and at discharge – mean number per patient

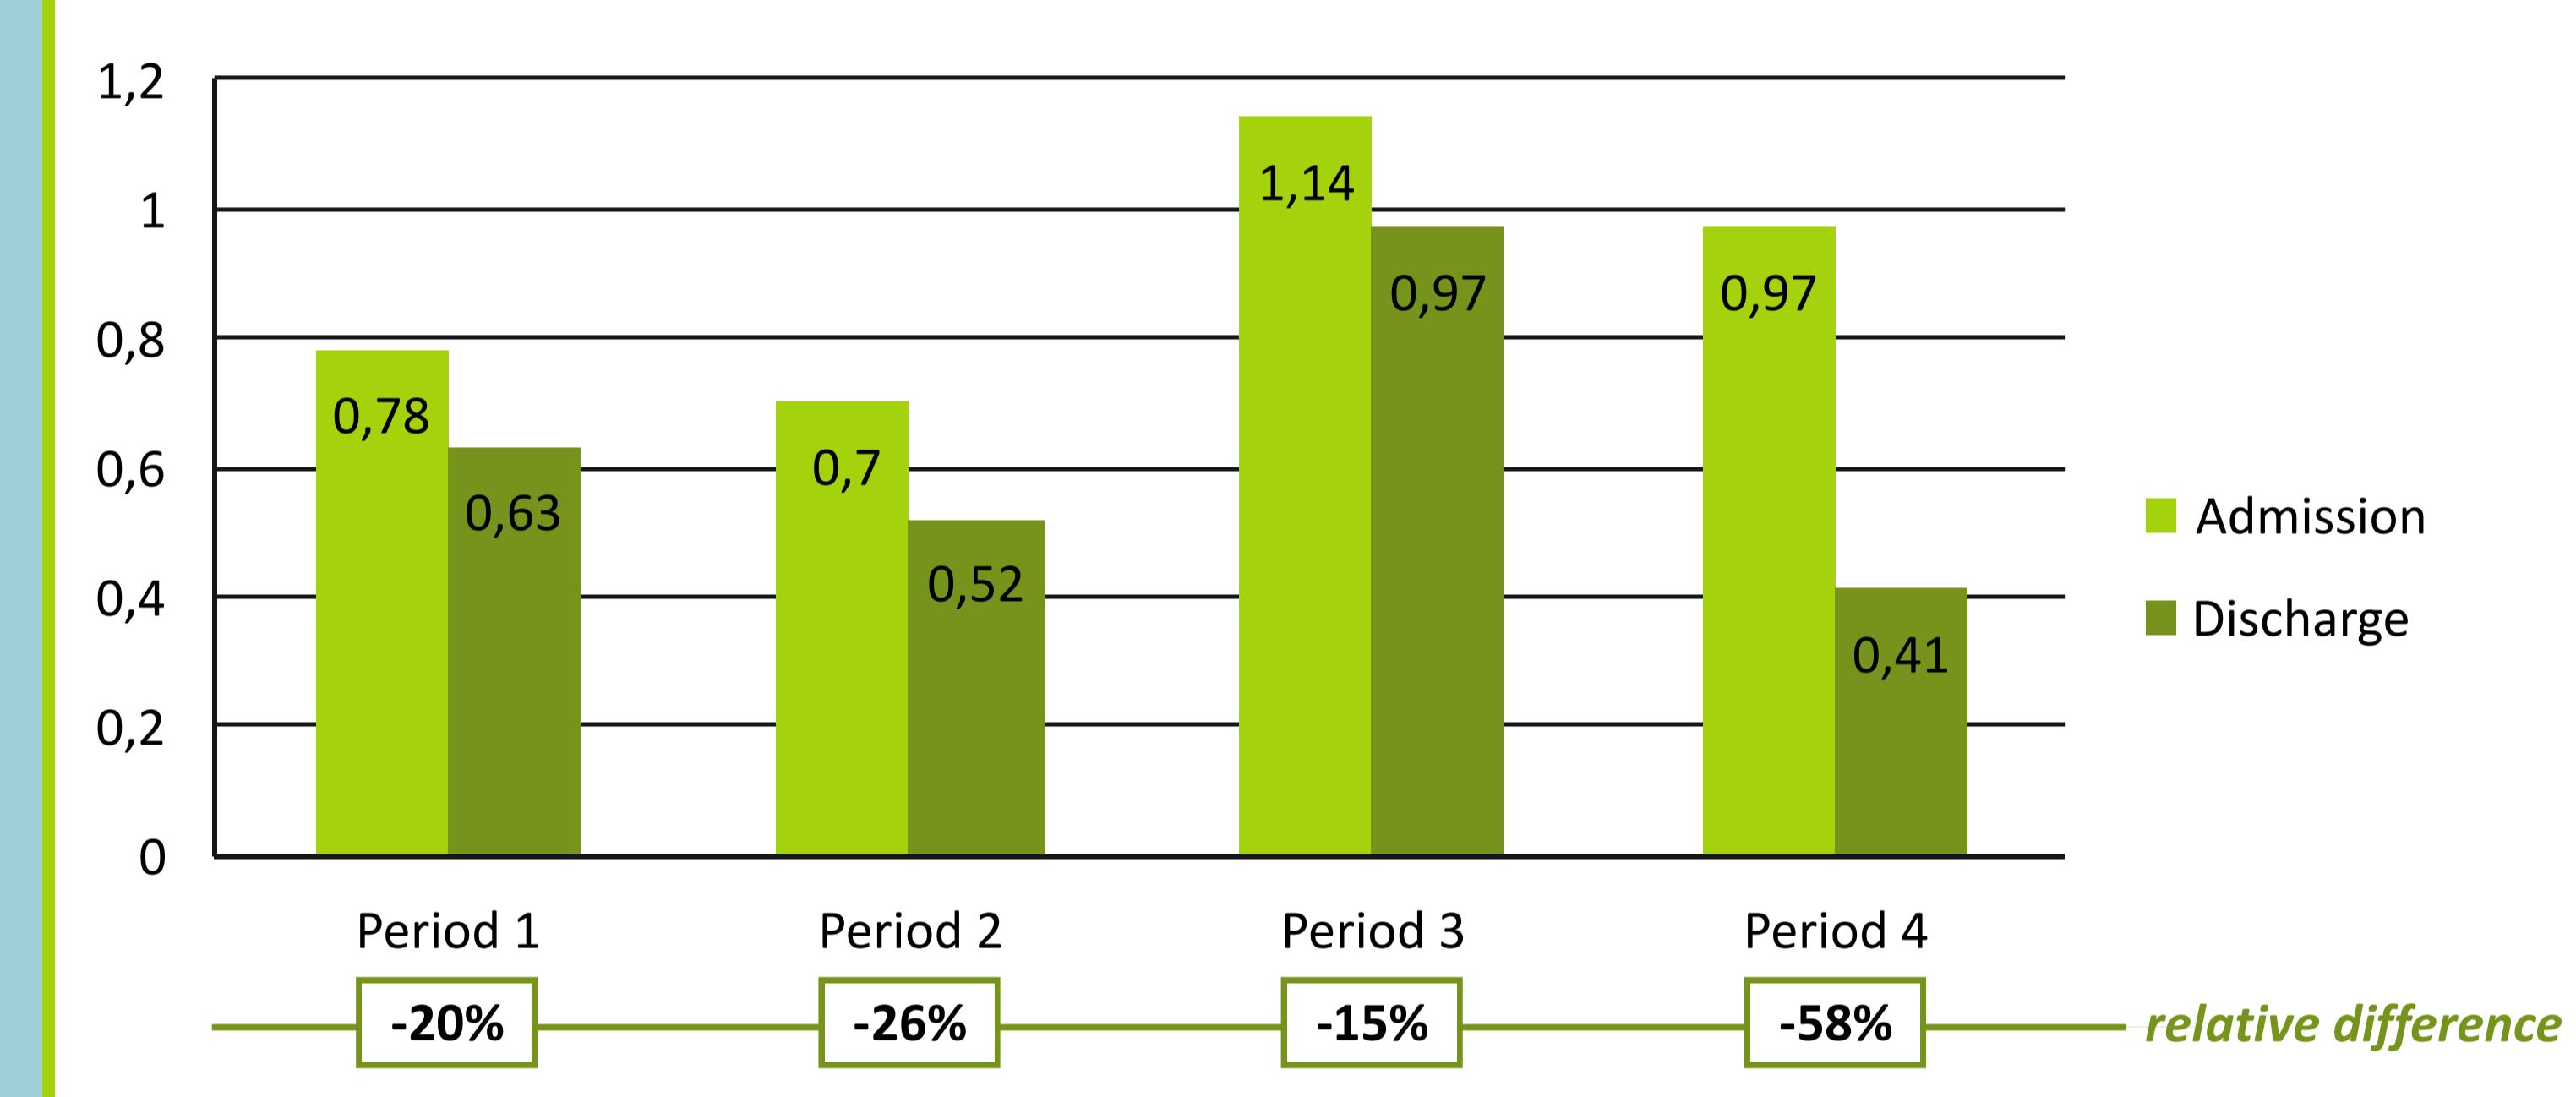

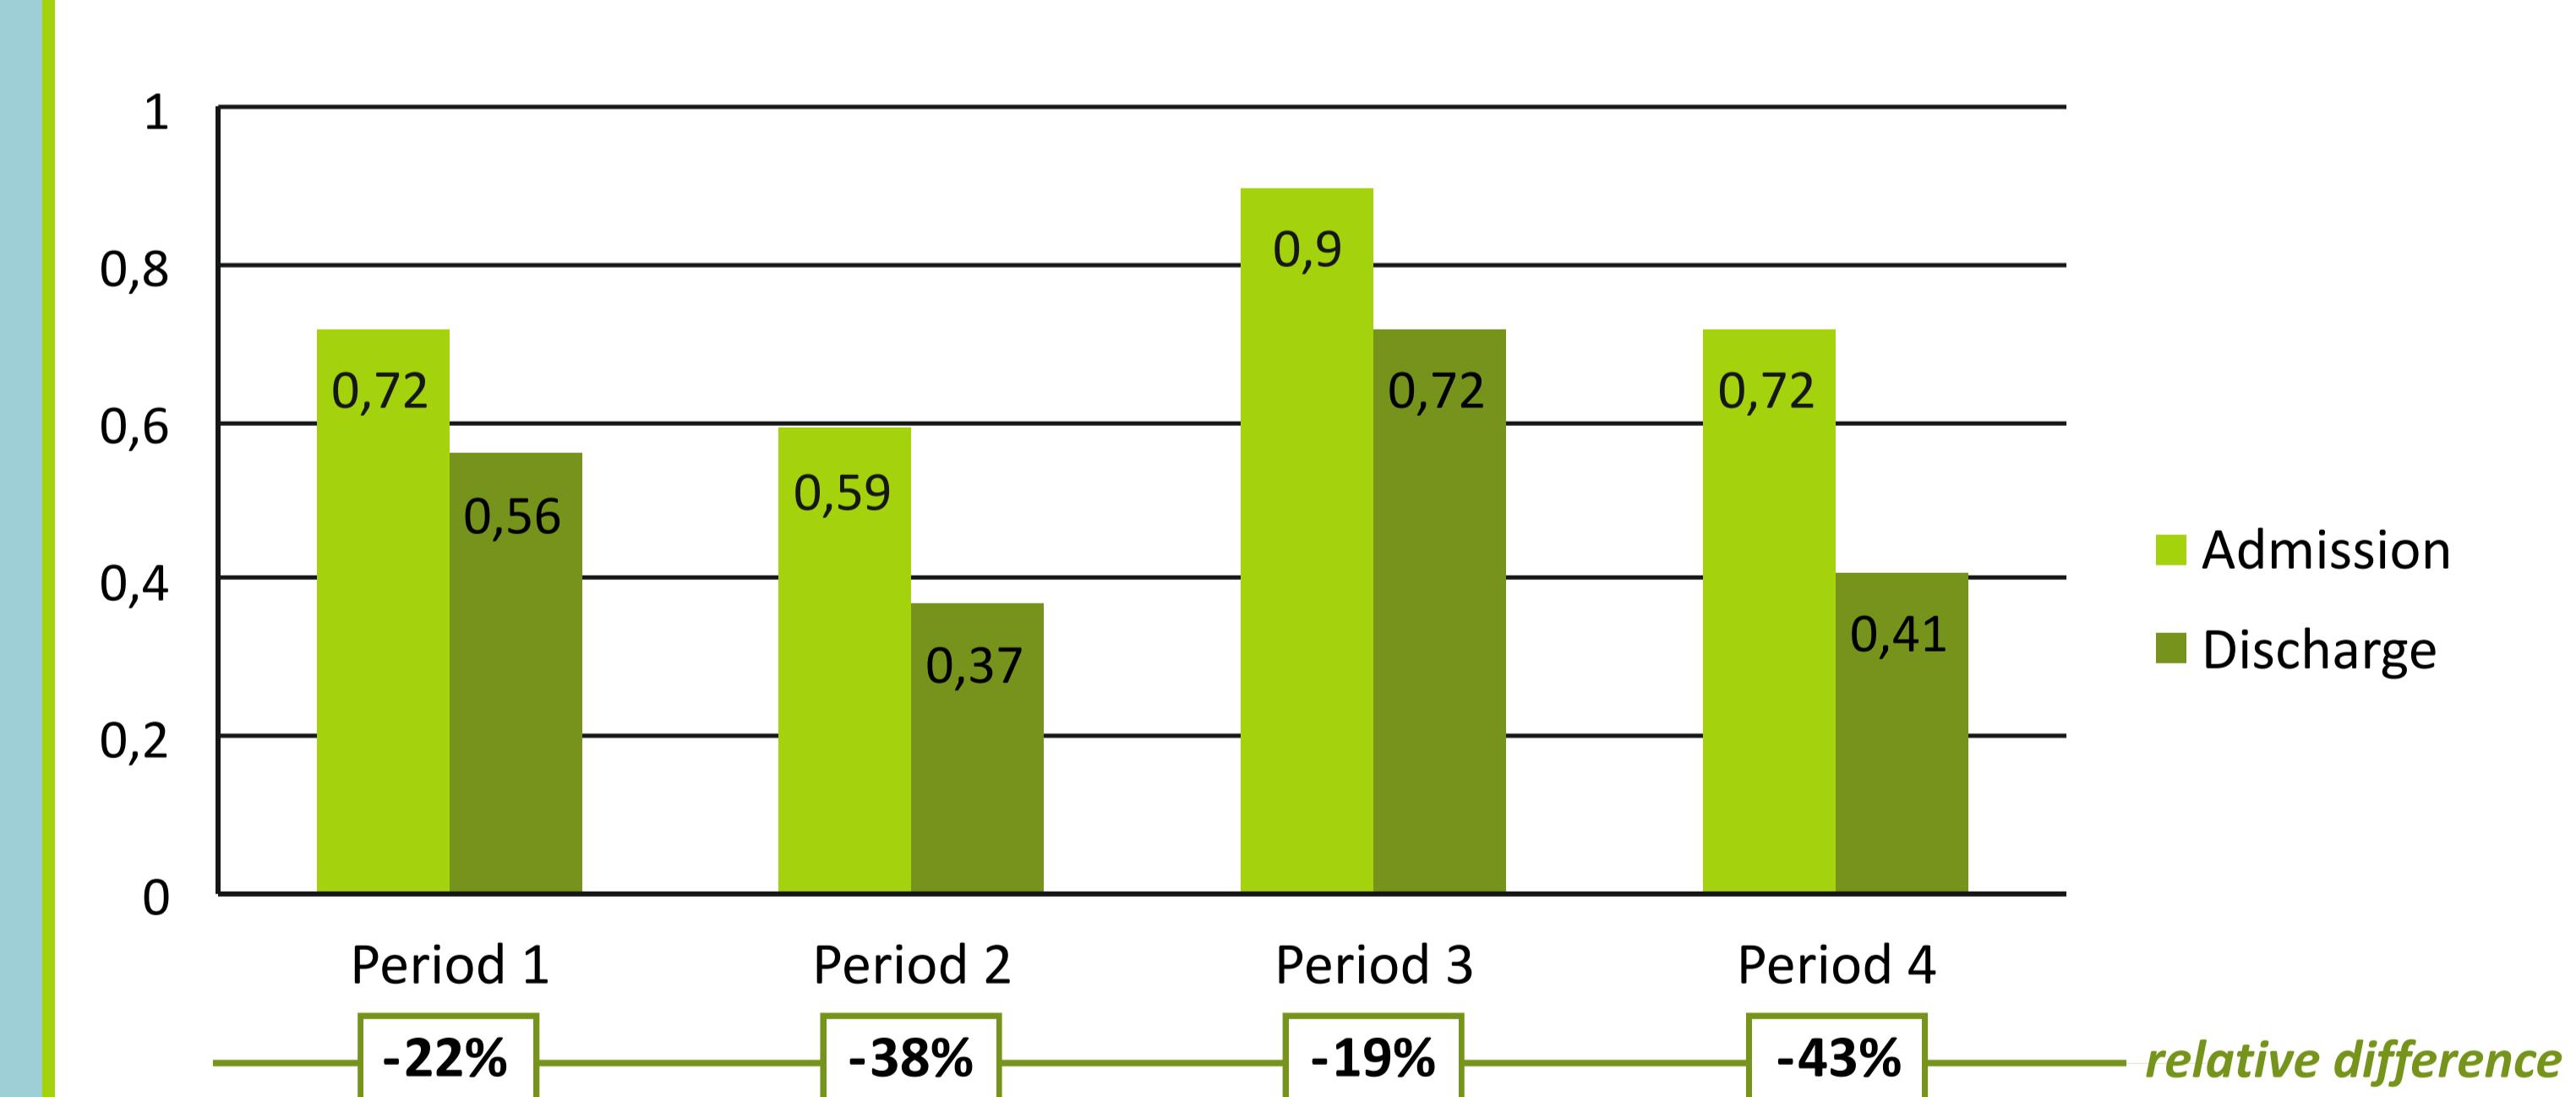

Figure 4: Potential prescribing omissions (PPOs) on admission and at discharge – mean number per patient

Conclusion

The implementation of a screening tool contributes to improve the appropriateness of prescribing in older patients. However efforts must be made in order to maintain a long-term effect. A multidisciplinary approach provides the greatest reduction in PIMs and PPOs and must therefore be encouraged.
